Inspection and Cleaning Standards

In 2005 the HVCA amalgamated two publications (TR/17 and DW/TM2) to produce the TR/19, which incorporates the best practice for installing new systems and maintaining kitchen extraction systems. TR/19 covers all aspects of the duct system in one publication.

TR/19 is ideal for use by operators, consultants and building legislators to ensure that ventilation systems are properly maintained. It is especially important for kitchen ventilation due to the elevated risk of grease deposits in extract systems, which can lead to fires. Adherence to the standards in TR/19 will provide detailed, recognised proof that the ventilation system in a building is safe and well maintained, which is vital for securing insurance policies.

The guide includes further improvements to best practice standards with particular reference to kitchen extract systems.

Certification of Kitchen Canopy and Duct/Exhaust System Cleaning

We offer total cleaning services for the entire Kitchen System (i.e. Hoods, Grease Filters, Ducts and Fans). This would include a comprehensive service report with photos and a video recording of the internal ductwork condition before and after cleaning.

Cert of Cleanliness issued on Completion of Service.

Kitchen Extract Cleaning and Certification

Canopy, Extract Fan & Duct Cleaning Service

We provide a 24 hour cleaning service of Canopies & Ducting, to a standard that meets Fire, Health, Safety and Insurance Guidelines.

All engineers are trained to operate to the standards laid out in TR19 and in accordance with current food safety guidelines contained in IS:340:2007.

Why Clean your Canopy, Extract Fan & Duct/Exhaust System?

• Fire Prevention Requirements

Grease contamination in Kitchen Canopy and Duct/Exhaust System can become a Potential Fire Hazard.

The majority of restaurant fires originate from the cooking equipment, that then flare into the Kitchen Exhaust Duct.

Regular cleaning of the entire Kitchen System is one of the most effective ways to prevent grease contamination and reduce the risk of Kitchen Fires.

• Food Hygiene Requirements

It is a requirement that the Kitchen Canopy and Duct/Exhaust System are cleaned on a regular basis. The cleanliness of this system is also one of the assessment criteria in Health Inspector Audits of food Service Establishments.

Enforcement action may also be taken by a Health Inspector against the FSE, who fail to keep their System clean.

• Contamination of Kitchen Canopy & Duct/Exhaust System

The majority of Kitchen Systems are fitted with low-efficiency Grease Filters that allow significant amounts of grease-laden vapours to enter the Kitchen System.

Over time, the internal surface of the entire system will become contaminated with grease or oily sludge.

Usage	Frequency of Cleaning	
	Hours/day	TR/19
Heavy	12-16	3 monthly
Moderate	6-12	6 monthly
Light	2-6	12 monthly

Canopy Filter Cleaning and Replacement

Super Drain Provides a Fast, Clean & Efficient Filter Cleaning Service.

Each Visit Involves:

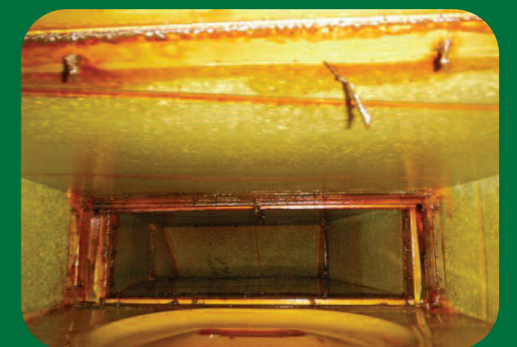

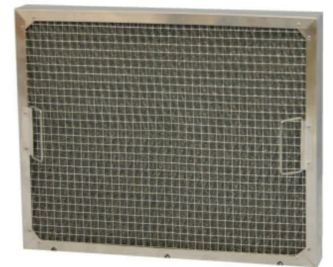

- The Removal of the Soiled/Contaminated Grease Filters
- Replace with Newly Cleaned Filters
- All Replacements are done within a matter of minutes, with no Interruption to service

All Canopy Grease Filters need to be cleaned on a regular basis to ensure that the extraction system is operating efficiently.

Super Drain provides an efficient and clean filter laundering service to all food service establishments.

This service can be provided weekly, fortnightly or monthly depending on your requirement.

We supply both the baffle grease filters and the mesh, but recommend that the mesh are changed out for baffle.
